Powerful Estimating Software with Automatic CAD/BIM Integration

“Truly next generation estimating software ... For the first time clients and designers can see on-screen what is included in the cost estimates and what is affordable.”

exactal

Exactal CostX is the powerful project costing solution for the property and construction industries. Now you can easily cost using live dimensions from CAD files without the need to learn complicated drawing software.

CostX features a variety of intelligent outline modes that accurately capture live dimensions on-screen. Highly portable, electronic CostX projects can be taken anywhere and shared with ease.

Developed by industry experts and leading software developers, CostX features a highly intuitive interface that is quick to learn and simple to use.

Designed to work seamlessly with existing industry standards, CostX provides an instant cost benefit saving on measurement time, printing costs, paper handling and storage costs, estimate review time, mobility (no longer office bound), report output time and reducing estimate errors.

With support for existing drawing formats such as Autodesk DWG, DXF and DWF, Adobe PDF, as well as the ability to import scanned or faxed drawings, highly accurate and flexible cost plans and reports can be generated in just minutes and exported to a wide variety of formats including PDF, Excel, and HTML.

CostX enables many people to concurrently work on the same project and automatically manages scope between revised drawings. Free form hierarchical spreadsheets and reports can be generated from supplied or custom cost libraries. Specialised cost libraries can also be automatically built from real projects to enhance the accuracy of future estimating.

Smart outline modes capture dimensions from CAD drawings on-screen with ease

Flexible hierarchical spreadsheets are generated at the click of a button

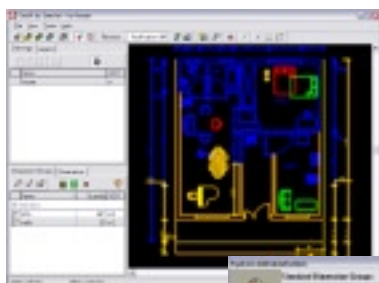

Smart Technology

A direct CAD-to-estimate link is critical to allow re-use of measured data and provide a platform for effective scope management. CostX's smart outlining modes are optimised for the quick capture of areas, lengths, and object counts, including positive and negative modes, sticky outlining, "quick point" area capture, Reo steel calculations and more. Using these simple techniques, the *Cost Geometry™* of buildings can be captured quickly, providing a live link between design and cost.

Now experts can focus on cost planning and control, freeing themselves from the measurement task which can be carried out by any person with a reasonable level of computer proficiency.

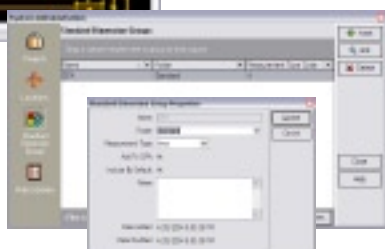

Full Control

CostX features powerful system administration which allows you to fully customise every aspect of your workflow from project management and standard dimension groups, to geographical locations, pricelists and more.

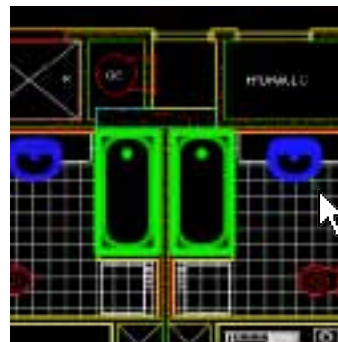

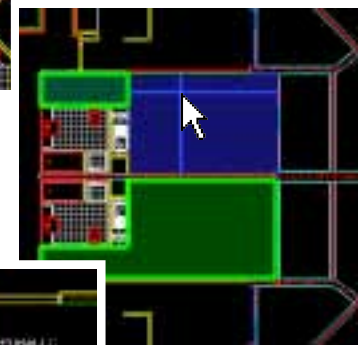

Colour coded drawing comparisons show revision modifications at a glance.

Customisation through system administration gives you complete control over projects and workflow.

"sticky" outlining makes capturing awkward areas easy

"quick point" area capture for accurate single click dimensions

CostX easily identifies similar objects in count mode

CostX can also directly import projects from existing standard estimating software, making the transition seamless and the benefits immediate.

System Requirements

- Windows XP or Windows 2000 Professional
- Pentium III 800MHz or faster
- 256MB RAM +
- Internet Connection (during activation)
